

DEPLOYMENT PROPOSAL: UNIFIED REVENUE COLLECTION SYSTEM (URCS)

Executive Summary

State governments, municipal councils, and revenue collection agencies face constant challenges with transparency, leakages, and manual reconciliation of tax collections. The **Unified Revenue Collection System (URCS)** is a modern, secure, and state-of-the-art software platform designed to digitize and automate the entire taxpayer portal, billing lifecycle, and multi-agency split disbursements.

By automating payout splits directly through tier-1 payment gateways at the point of transaction, URCS eliminates manual reconciliation, ensures real-time fund delivery to department ledgers, and guarantees a tamper-proof digital trail.

Core Features & Capabilities

1. Dynamic Split Payouts & Automated Division

- **Core Multi-Agency Splits:** Automatically splits a single checkout payment into designated portions for different state agencies (e.g., Land Bureau, Commerce, Environmental).
- **Service Fee Splits:** Supports operational service provider splits (`is_service_fee`). Transaction service fees are split out automatically at the gateway level, directing the net revenue to the government and the transaction charge to the service provider's subaccount.
- **Subaccount Routing:** Integrates directly with Paystack and Monnify split payment APIs, eliminating the manual tracking of collection accounts.

2. Taxpayer Portal & Self-Service

- **Business Establishment Lookup:** Taxpayers can search by business name, owner name, or registration ID to check their compliance profile.
- **Interactive Guides & Accordion FAQs:** Beautiful step-by-step payment tutorials and FAQ panels matching the dynamically configured brand colors.
- **Secure Digital Receipts:** Instantly downloads tamper-proof PDF receipts with unique verification QR codes.

3. Business Establishment Lifecycle (CRUD & Audits)

- **Establishment Classifications:** Standardizes business types and size scales (e.g., Micro, Small, Medium, Large) to automate correct tax rate lookups.
- **Profile Update Workflows:** Provides a formal process where establishment change requests are held in a pending queue for approval or rejection by authorized admins.

4. Admin Billing & Payment Recovery

- **Invoice Grouping:** Groups multiple tax items into one invoice for a simplified, single checkout experience.
- **Instant Payment Re-verification:** In the event of network/webhook failures, admins can trigger a manual "Reverify Payment" check. This queries the payment gateway API directly and updates the system state synchronously to prevent duplicate payments.

5. Advanced Analytics & Exporting Tools

- **Interactive Dashboards:** Visualizes data through premium charts (Pie, Bar, Line) representing agency collection share, payment modes, and monthly revenue trends.
- **Precise Calendar Filters:** Incorporates custom calendar widgets to query precise date ranges.
- **Exporting Options:** Generates complete Excel/CSV data logs containing transaction references, split breakdown, and transaction status.

Security, Roles, & Permissions

Built on top of a strict Spatie Role-Based Access Control (RBAC) matrix:

- **Protected Actions:** Critical tasks (such as payment reverification, invoice creation, and establishment approval) require specific permissions.
- **Super-Admin Supervision:** Restricts system-wide configurations, agency registry, and fee setups to root super-admins.
- **Tamper-Proof Ledger:** Tracks all logged security records and audit logs.

Implementation & Deployment Strategy

The application is built on **Laravel 11**, utilising vanilla CSS/Tailwind engines and Outfit typography to deliver a premium look and feel.

- **Phase 1: Environment Setup:** Configuration of settings, dynamic branding, and database seeders.
- **Phase 2: Agency Subaccount Linkage:** Linking Paystack/Monnify subaccounts to active agencies.
- **Phase 3: UAT & Launch:** Staff onboarding, taxpayer lookup test sessions, and public portal release.
